

SJSU advanced interfaces project 3 Expanded Networks

For the third project of the semester you are asked to work in a team of students to create a networked based artwork using a Raspberry Pi for installation in a gallery. Based on artworks that we have looked at in class, and the processes that we have learned using javascript throughout the semester, your work should use networking technology in nonconventional ways. Think beyond the computer screen and consider that in the gallery most viewers will be interacting with your work via cell phone. Can your artwork extend beyond the gallery walls? Is your artwork specific to the gallery? What ways can you push the medium of the internet, networking, and the use of the Raspberry Pi in this installation? Remember that the works should display both conceptual depth and technical craftsmanship. Also note that you will be grading your peers for this project, so please make sure everyone is contributing to the projects in a fair and meaningful way.

As always if you have any questions or concerns technically or conceptually feel free to contact me: andrew@andrewblanton.com or come to office hours at Art 311 from 11-12 a.m. on Tuesdays and Thursdays.
